title: Executive Dashboard Structure — Data Point Mapping applies_to: defaultProject.pbip (PBI_Sample) status: draft

Executive Dashboard Structure — Data Point Mapping

This document maps each item in the recommended **Executive Dashboard Structure** (Investment → Adoption → Productivity → Quality → Business Value → Risk) to the concrete data points available in this project's semantic model (`defaultProject.SemanticModel`), so each section of the executive story can be answered from existing tables/measures, or flagged as a gap.

Legend:

- ✅ Available now — measure/column already exists in the model
- ⚠️ Partially available — related data exists but needs a new measure or assumption
- ❌ Not available — no source data in this project; requires external data (e.g. GitHub API, Azure DevOps, Remedy)

1. Investment

Item	Status	Data Point(s)	Notes
Licences	✅	`DimDeveloper` (1 row = 1 assigned seat) → measure `[Assigned Seats]` ; `DimBusinessUnit[EligibleDevelopers]` → measure `[Eligible Developers]`	Eligible vs. assigned gives licence utilisation headroom

Item	Status	Data Point(s)	Notes
Cost	✅	Measures `[Licence Cost]`, `[AI Credit Cost]`, `[Enablement Cost]`, rolled up in `[Copilot Investment]`; rates sourced from `Assumptions` table (`LicenceCostPerSeatMonth`, `AICreditCostPerUnit`, `EnablementCostMonth`)	Cost is modelled from assumptions, not actual billing data — replace with real licence invoice data if/when available

2. Adoption

Item	Status	Data Point(s)	Notes
Active Users (%)	✅	Measure `[Adoption Rate]` = `[Active Users]` ÷ `[Assigned Seats]`; underlying `FactTeamDaily[ActiveUsers]` (peak by team)	Page: `pt-adoption-rate`, `pt-active-users`
Adoption Phases	⚠️	`ValueChain` table (`StepOrder` / `StepName`: Eligible Developers → Assigned Seats → Active Users → Engaged Users → Sustained Users) + measure `[Value Chain Count]`	This models a funnel, not GitHub's native "adoption phase" taxonomy (code completion → IDE agent → agent-first → multi-agent). To match GitHub's phases exactly, source `copilot/usage` or `copilot/metrics` API adoption-phase fields
Agent Adoption	⚠️	`FactTeamDaily[AgentSessions]` → measure `[Agent Sessions]`; `FactTeamDaily[CodingAgentPRsCreated]` / `[CodingAgentPRsMerged]` → measures `[Coding Agent PRs Created]` / `[Coding Agent PRs Merged]`	Covers agent usage volume, not yet a %-of-users-using-agents adoption metric

Item	Status	Data Point(s)	Notes
Training	❌	No training-completion table/column in this model	Needs an external training/LMS source (e.g. Learning Pathways completion data) joined on `DeveloperKey` / `TeamKey`

3. Productivity

Item	Status	Data Point(s)	Notes
PR Cycle Time	✅	`FactTeamDaily[PRCycleTimeHours]` → measure `[Median PR Cycle Time (hrs)]`; baseline delta via `[PR Cycle Time Δ vs Baseline]`	Page: `pt-median-pr-cycle-time-hrs`
Deployment Frequency	✅	`FactTeamDaily[Deployments]` → measure `[Deployments]`; `FactTeamDaily[FailedDeployments]` → `[Failed Deployments]`	Page: `pt-deployments`
Release Frequency	⚠️	Same underlying `FactTeamDaily[Deployments]` — treat deployments as proxy for releases unless a separate "release" event/tag exists	No distinct release-train data in model; equate to Deployments or source from pipeline/release manager if tracked separately
Hours Saved	✅	Measure `[Estimated Hours Saved]` = `[Suggestions Accepted]` × `Assumptions[MinutesSavedPerAcceptedSuggestion]` ÷ 60	Page: `pt-estimated-hours-saved`; derived/estimated, not measured directly

Supporting productivity measures also available: `[PRs Merged]`, `[Avg Time to First Review (hrs)]`, `[Avg Lead Time (hrs)]`, `[Throughput per Active Engineer]`, `[Suggestions Made]`, `[Suggestions Accepted]`, `[Code Acceptance Rate]`, `[Lines Accepted]`, `[Chat Sessions]`.

4. Quality

Item	Status	Data Point(s)	Notes
Code Quality	⚠️	`FactMonthlyQuality[BuildSuccesses]` / `[BuildRuns]` → `[Build Success Rate]`; `[Flow State Score]`, `[Tooling Satisfaction]`, `[Copilot Satisfaction]` as proxy quality/experience indicators	No static-analysis/code-smell metric in model; add if a SAST/code-quality tool is integrated
Defects	✅	`FactMonthlyQuality[EscapedDefects]` → measure `[Escaped Defects]`	Page: `pt-escaped-defects`
Rework	✅	`FactTeamDaily[ReworkedPRs]` → measure `[Reworked PRs]`; rate via `[Rework Rate]` = Reworked PRs ÷ PRs Merged	Page: `pt-rework-rate`
MTTR	✅	`FactMonthlyQuality[MTTRHours]` → measure `[MTTR (hrs)]`	Page: `pt-mttr-hrs`. Standard Bank's MTTR is sourced from Remedy — confirm this table is fed from the same Remedy methodology before treating it as authoritative

Item	Status	Data Point(s)	Notes
Compliance	⚠️	`FactMonthlyQuality[VulnerabilitiesIntroduced]` → `[Vulnerabilities Introduced]`; `[Change Failure Rate]` (`ChangeFailures` / `TotalChanges`) as a compliance/stability proxy	No explicit policy/licence-compliance flag table; Dependabot/security-scan and policy-compliance data would need to be imported separately

Also available: `[Test Coverage %]`, `[Test Pass Rate]`, `[Tech Debt Items]`.

5. Business Value

Item	Status	Data Point(s)	Notes
Capacity Released	✅	Measure `[Capacity Released (FTEs)]` = `[Estimated Hours Saved]` × `Assumptions[CapacityConversionPct]` ÷ (`HoursPerFTEMonth` × months)	Page: `pt-capacity-released-ftes`
Initiatives Accelerated	❌	No initiative/project-linkage table in this model	Per meeting notes, requires linking repos/PRs/pipelines to a business-initiative identifier — deferred phase. Would need a `DimInitiative` table + repo/application mapping
Rand Value Realised	✅	Measures `[Gross Capacity Value]`, `[Avoided Defect Cost]`, `[Net Value]`, `[ROI %]`, `[Benefit-Cost`	Pages: `pt-net-value`, `pt-roi`, `pt-benefit-cost-ratio`, `pt-gross-capacity-value`, `pt-`

Item	Status	Data Point(s)	Notes
		`Ratio]`	`avoided-defect-cost`. All driven by `Assumptions` table rates — validate against real finance figures before presenting externally

6. Risk

Item	Status	Data Point(s)	Notes
Inactive Licences	✅	Measure `[Inactive Seats]` = `[Assigned Seats]` – `[Active Users]`	Page: `pt-inactive-seats`
Technical Debt Indicators	✅	`FactMonthlyQuality[TechDebtItems]` → measure `[Tech Debt Items]`	No trend/severity breakdown currently — consider adding a severity column if source data supports it
Security & Compliance Issues	⚠️	`FactMonthlyQuality[VulnerabilitiesIntroduced]` → `[Vulnerabilities Introduced]`	Covers vulnerabilities only; Dependabot alerts / secret-scanning findings / policy-compliance status are not yet modelled and would need to be imported from GitHub Advanced Security or Azure DevOps

Summary of gaps requiring new/external data

1. **Training completion** — needs an LMS/Learning Pathways data source.

2. **GitHub-native Adoption Phases** (code completion → IDE agent → agent-first → multi-agent) — needs direct ingestion from the GitHub Copilot metrics/usage API; current `ValueChain` funnel is a local approximation.
3. **Initiatives Accelerated** — needs a business-initiative dimension and repo/application-to-initiative mapping.
4. **Code quality (static analysis)** and **security/compliance findings** (Dependabot, secret scanning, policy compliance) — needs GitHub Advanced Security / CI-CD compliance data imported and joined by repository/application identifier.
5. **Cost and value-realisation figures** are currently driven by assumption-table rates (`Assumptions` table), not actual invoiced/finance data — treat as estimates until validated.
